1-using apt install apache2:

2-install php for apache2:

3-create new virtual host:

```
NU nano 6.2                         001-Admin2Lab4.conf *
rtualHost *:80>
    # The ServerName directive sets the request scheme, hostname and port >
    # the server uses to identify itself. This is used when creating
    # redirection URLs. In the context of virtual hosts, the ServerName
    # specifies what hostname must appear in the request's Host: header to
    # match this virtual host. For the default virtual host (this file) th>
    # value is not decisive as it is used as a last resort host regardless.
    # However, you must set it for any further virtual host explicitly.
    ServerName www.admin2lab4.local

    ServerAdmin admin@localhost
    DocumentRoot /var/www/admin2lab4
```

4-configure /etc/hosts for php site :

```
  GNU nano 6.2                              hosts
127.0.0.1       localhost
127.0.0.1       admin2lab4.local
```

5- disable dir for the new virtual host:

```
DocumentRoot /var/www/html/admin_lab4
ErrorLog /var/log/apache2/admin_lab4.error.log
CustomLog /var/log/apache2/admin_lab4.access.log combined
<Directory /var/www/html/admin_lab4>
Options -Indexes
AllowOverride All
Require all granted
</Directory>
</VirtualHost>
```
